# Tock Embedded OS Tutorial

Octopi Kickoff 2018

*Please make sure you have completed all of the tutorial pre-requisites. If you prefer, you can download a virtual machine image with all the pre-requisites already installed.*

https://github.com/alevy/tock-chalmers/tree/master/doc/courses/chalmers/README.md

*aka*

https://goo.gl/s17fy8

# Agenda Today

1. Intro to hardware, tools and development environment
2. Write an end-to-end Bluetooth Low Energy environment sensing application
3. Add functionality to the Tock kernel

# Part 1: Hardware, tools and development environment

# Hail

# Binaries on-board

Bootloader

Kernel

Processes

# Tools

- `make` (just instrumenting `cargo` and the bootloader tool)
- Rust (nightly for `asm!`, compiling `core`, etc)
- `tockloader` to interact with the board

# Tools

Program the kernel

```
$ make program
```

Program a process in Tock Binary Format[1]:

```
$ make APP=myapp.tbf program-app
```

Connect to the debug console:

```
$ tockloader listen
```

[1] TBFs are relocatable process binaries prefixed with headers like the package name.

# Check your understanding

1. What kinds of binaries exist on a Tock board? Hint: There are three, and only two can be programmed using `tockloader`.
2. Can you point to the chip on the LaunchXL that runs the Tock kernel? How about the processes?
3. What steps would you follow to program a processes onto LaunchXL? What about to replace the kernel?

# Hands-on: Set-up development environment

1. Compile and flash the kernel

   - Head to <http://bit.ly/2lniNt6> to get started!
   - (https://github.com/alevy/tock-chalmers/blob/master/doc/courses/chalmers/environment.md)

# Part 2: User space

# System calls

| Call | Target | Description |
|---|---|---|
| command | Capsule | Invoke an operation on a capsule |
| allow | Capsule | Share memory with a capsule |
| subscribe | Capsule | Register an upcall |
| memop | Core | Modify memory break |
| yield | Core | Block until next upcall is ready |

# C System Calls: command & allow

```
int command(uint32_t driver, uint32_t command,
            int arg1, int arg2);

int allow(uint32_t driver, uint32_t allow, void* ptr,
          size_t size);
```

# C System Calls: subscribe

```
typedef void (subscribe_cb)(int, int, int,
                            void* userdata);

int subscribe(uint32_t driver, uint32_t subscribe,
              subscribe_cb cb, void* userdata);
```

# C System Calls: `yield` & `yield_for`

```
void yield(void);

void yield_for(bool *cond) {
  while (!*cond) {
    yield();
  }
}
```

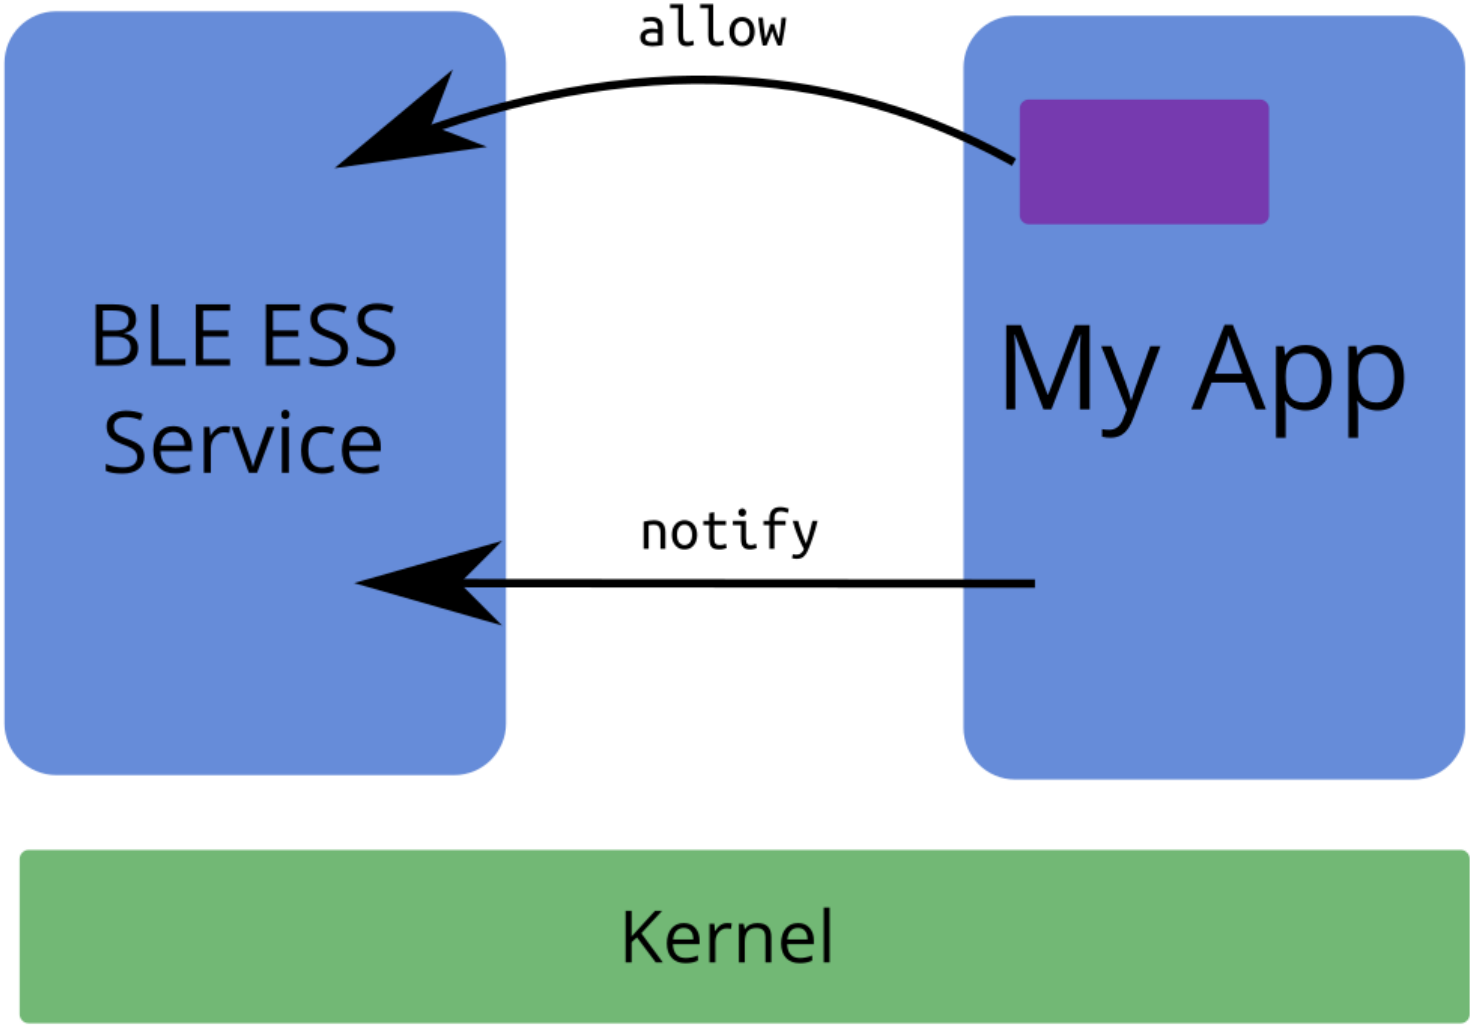
# Example: printing to the debug console

```
static void putstr_cb(int _x, int _y, int _z, void* ud) {
  putstr_data_t* data = (putstr_data_t*)ud;
  data->done = true;
}

int putnstr(const char *str, size_t len) {
  putstr_data_t data;
  data.buf = str;
  data.done = false;

  allow(DRIVER_NUM_CONSOLE, 1, str, len);
  subscribe(DRIVER_NUM_CONSOLE, 1, putstr_cb, &data);
  command(DRIVER_NUM_CONSOLE, 1, len, 0);
  yield_for(&data.done);
  return ret;
}
```

# Inter Process Communication (IPC)



# Tock Inter Process Communication Overview

*Servers*

- Register as an IPC service
- Call `notify` to trigger callback in connected client
- Receive a callback when a client calls `notify`

*Clients*

- Discover IPC services by application name
- Able to share a buffer with a connected service
- Call `notify` to trigger callback in connected service
- Receive a callback when service calls `notify`

# Inter Process Communication API

```
// discover IPC service by name
// returns error code or PID for service
int ipc_discover(const char* pkg_name);

// shares memory slice at address with IPC service
int ipc_share(int pid, void* base, int len);

// register for callback on server `notify`
int ipc_register_client_cb(int pid, subscribe_cb cb,
                           void* userdata);

// trigger callback in service
int ipc_notify_svc(int pid);

// trigger callback in a client
int ipc_notify_client(int pid);
```

# Check your understanding

1. How does a process perform a blocking operation? Can you draw the flow of operations when a process calls `delay_ms(1000)`?
2. How would you write an IPC service to print to the console? Which functions would the client need to call?

# Hands-on: Write a BLE environment sensing application

1. Get an application running on LaunchXL
2. Print "Hello World" every second
3. Extend your app to sample on-board sensors
4. Extend your app to report through the `ble-env-sense` service

- Head to <`http://bit.ly/2hgpl8n`> to get started!
- (github.com/tock/tock/blob/master/doc/courses/sosp/application.md)

# Part 3: The kernel

# Trusted Computing Base (`unsafe` allowed)

- Hardware Abstraction Layer
- Board configuration
- Event & Process scheduler
- Rust `core` library
- Core Tock primitives

```
kernel/
chips/
```

# Capsules (`unsafe` not allowed)

- Virtualization
- Peripheral drivers
- Communication protocols (IP, USB, etc)
- Application logic

`capsules/`

# Constraints

## Small isolation units

Breaking a monolithic component into smaller ones should have low/no cost

## Avoid memory exhaustion in the kernel

No heap. Everything is allocated statically.

## Low communication overhead

Communicating between components as cheap as an internal function call. Ideally inlined.

# Event-driven execution model

```
pub fn main<P, C>(platform: &P, chip: &mut C,
                  processes: &mut [Process]) {
    loop {
        chip.service_pending_interrupts();
        for (i, p) in processes.iter_mut().enumerate() {
            sched::do_process(platform, chip, process);
        }

        if !chip.has_pending_interrupts() {
            chip.prepare_for_sleep();
            support::wfi();
        }
    }
}
```

# Event-driven execution model

```
fn service_pending_interrupts(&mut self) {
    while let Some(interrupt) = get_interrupt() {
        match interrupt {
            ASTALARM => ast::AST.handle_interrupt(),
            USART0 => usart::USART0.handle_interrupt(),
            USART1 => usart::USART1.handle_interrupt(),
            USART2 => usart::USART2.handle_interrupt(),
            ...
        }
    }
}
```

# Event-driven execution model

```
impl Ast {
    pub fn handle_interrupt(&self) {
        self.clear_alarm();
        self.callback.get().map(|cb| { cb.fired(); });
    }
}
impl time::Client for MuxAlarm {
    fn fired(&self) {
        for cur in self.virtual_alarms.iter() {
            if cur.should_fire() {
                cur.armed.set(false);
                self.enabled.set(self.enabled.get() - 1);
                cur.fired();
            }
        }
    }
}
```

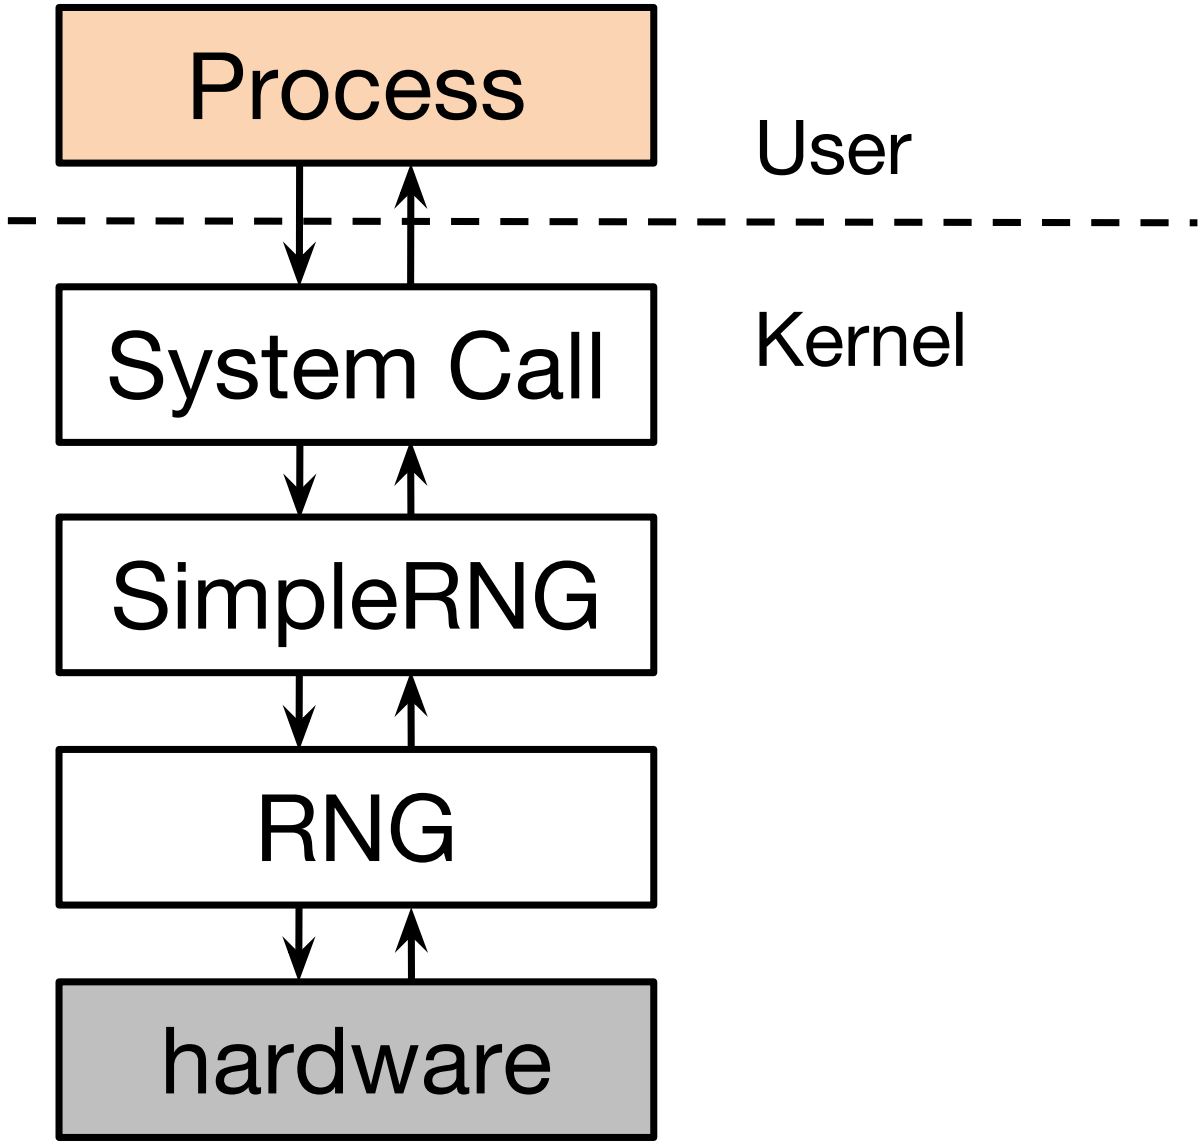


Figure 1: Capsules reference each other directly, assisting inlining

# The mutable aliases problem

```
enum NumOrPointer {
  Num(u32),
  Pointer(&mut u32)
}

// n.b. will not compile
let external : &mut NumOrPointer;
match external {
  Pointer(internal) => {
    // This would violate safety and
    // write to memory at 0xdeadbeef
    *external = Num(0xdeadbeef);
    *internal = 12345;  // Kaboom
  },
  ...
}
```

# Interior mutability to the rescue

| Type | Copy-only | Mutual exclusion | Opt. | Mem Opt. |
|---|---|---|---|---|
| `Cell` | ✓ | ✗ | ✓ | ✓ |
| `VolatileCell` | ✓ | ✗ | ✗ | ✓ |
| `TakeCell` | ✗ | ✓ | ✗ | ✓ |
| `MapCell` | ✗ | ✓ | ✓ | ✗ |

```rust
pub struct Fxos8700cq<'a> {
  i2c: &'a I2CDevice,
  state: Cell<State>,
  buffer: TakeCell<'static, [u8]>,
  callback:
    Cell<Option<&'a hil::ninedof::NineDofClient>>,
}

impl<'a> I2CClient for Fxos8700cq<'a> {
  fn cmd_complete(&self, buf: &'static mut [u8]) { ... }
}

impl<'a> hil::ninedof::NineDof for Fxos8700cq<'a> {
  fn read_accelerometer(&self) -> ReturnCode { ... }
}

pub trait NineDofClient {
  fn callback(&self, x: usize, y: usize, z: usize);
}
```

# Check your understanding

1. What is a `VolatileCell`? Can you find some uses of `VolatileCell`, and do you understand why they are needed? Hint: look inside `chips/sam4l/src`.
2. What is a `TakeCell`? When is a `TakeCell` preferable to a standard `Cell`?

# Hands-on: Write and add a capsule to the kernel

1. Read the Hail boot sequence in `boards/hail/src/main.rs`
2. Write a new capsule that prints "Hello World" to the debug console.
3. Extend your capsule to print "Hello World" every second
4. Extend your capsule to print light readings every second
5. Extra credit
